

# FORM-A-DRAIN® PLUS

Think of it as Underground Insurance

**30 YEAR DRY BASEMENT GUARANTEE**

Although you don't see it, the system at the very base of your home that provides drainage to your foundation plays a critical role in keeping your basement or crawlspace dry. Form-A-Drain is the highest quality, most innovative foundation drainage system on the market today.

Form-A-Drain outlines the footing, a strip of concrete that defines the basement perimeter and upon which the basement walls rest. Because it's installed before the footing is poured and stays in place permanently, Form-A-Drain is always in the optimum position — right up against the side of the footing and level with its top — to provide superior drainage, either to a sump pit or away from the house.

Other drainage systems are designed to be installed after the footing is poured, making it difficult to maneuver them into the correct position. As a result, they may not be as effective in channeling water from your foundation.

Form-A-Drain's unique design and the fact that it encloses the entire perimeter of the foundation also allows it to be adapted for use as a part of a radon venting system where needed. This avoids the need to drill holes in your new walls and floors after the house has been built.

You don't see Form-A-Drain once your new home is complete, but knowing it's there, helping to keep you and your family dry and comfortable, is a good feeling.

Start off on the right footing. Tell your builder you want Form-A-Drain Plus, the best foundation drainage and venting system available.
